

I think the key point is that platform features do not simply enable participation; they shape the form and value of participation. For example, danmu turns watching into collective, real-time meaning-making, while comments create a slower and more separated form of discussion. Short-form feeds encourage quick reactions and trend-based participation, whereas long-form videos allow deeper reflection. Algorithms further decide which forms of participation become visible, and AI tools may lower barriers to creation while also standardizing creative expression. Therefore, participation on platforms is never neutral. It can create community and meaning, but it can also become engagement labor that benefits the platform.

7. Scott (2019)

Algorithms are not neutral tools; they shape information, attention, and behavior through metrics like watch time, often creating misinformation, anxiety, and invisible forms of control.

三、Creators & Influencers (创作者与影响者)

8. Hofstetter & Gollnhofer

Creators face a dilemma between monetization and authenticity, because earning money through sponsorships can threaten the trust and “realness” that made audiences follow them.

9. Ellis – Manufactured Authenticity

YouTube authenticity is often carefully performed and strategically produced, meaning that “being real” online is frequently a form of emotional labor and commercial design.

Fan (2024)

Influencers survive by being both “in and against the platform,” meaning they cooperate with platform logic while also resisting total self-commodification.

11. Bateman (2026)

Artists often realize that chasing platform visibility and commercial success can disconnect them from the real purpose of art, which is communication, community, and meaningful expression.

四、Online Video Marketing (在线视频营销)

12. Healey

Modern branding increasingly depends on people becoming brands themselves, because audiences trust individuals more than institutions and cultural influence matters more than simple advertising reach

13. Duffeck

Influencer authenticity is built through expertise, connectedness, integrity, originality, and transparency, and different stakeholders value these qualities differently.

14.Fone & Cole (2025)

Short-form platforms reduce user agency not mainly because videos are short, but because infinite scroll, algorithmic delivery, and autopilot consumption weaken analytical thinking, intention maintenance, and deep reflection.

16. Wang & Guo (2023)

TikTok addiction is shaped not only by user motivation and recommendation algorithms, but also by algorithm awareness, since understanding how algorithms work can reduce passive consumption and addictive behavior.

17. Wang et al. (2025)

Elderly fandom on TikTok appears to be emotional participation and companionship, but it is actually structured by platform logic that turns loneliness and emotional needs into commodified fan economy and passive consumption.

18. Green (2024)

Media revolutions often increase populism and social instability because decentralized communication weakens institutional trust, making people trust emotional narratives more than expertise, journalism, and traditional authority.
